

## HISTORY OF TRANSPLANTING MOUNTAIN GOATS AND MOUNTAIN SHEEP – WYOMING

KEVIN P. HURLEY, Wyoming Game and Fish Department (WGFD), 356 Nostrum Road, Thermopolis, WY 82443

### ROCKY MOUNTAIN GOATS

Two populations of Rocky Mountain goats have been established in Wyoming, due to immigrant goats entering Wyoming from out-of-state transplants. The Clarks Fork herd in northern Wyoming's Beartooth Mountains was established via immigration from a 1942 Montana Fish, Wildlife, and Parks (MTFWP) transplant of 14 goats into the Beartooth Mountains west of Red Lodge (Cooney 1946, Hanna 1989). Current estimates suggest 150-175 mountain goats occupy the Wyoming portion of the Beartooth Mountains.

A small but expanding herd of 15-30 mountain goats exists in the Snake River Range between Alpine and Wilson, southwest of Jackson, Wyoming. This herd started from goats moving into Wyoming from 1969, 1970, and 1971 transplants of at least 12 goats by the Idaho Department of Fish and Game (IDFG) in the Palisades area of Idaho's Unit 67 (Hayden 1984).

In addition to these free-ranging populations, in 1956 and 1957 10 goats from Montana were placed in captivity at WGFD's Sybille Research Unit southwest of Wheatland (WGFD 1956). An unverified report indicates Sybille received 9 mountain goats from the Harney Peak area of South Dakota in 1960.

### ROCKY MOUNTAIN BIGHORN SHEEP

The earliest known transplant of mountain sheep within Wyoming by WGFD was in 1934 (Helms 1974), when 20 bighorns were captured in Flat Creek Canyon, east of the National Elk Refuge. In a project largely initiated by the Sheridan Sportsmen's Club, these 20 sheep were transplanted into Paintrock Canyon on the west slope of the Bighorn Mountains.

Interestingly, in August 1944, 7 desert bighorn sheep from Nevada (presumably from the Desert Game Range) were released in the Sweetwater Rocks of central Wyoming (Kinter et al. 1992). This transplant is the only known release of desert sheep into Wyoming.

No further capture or movement of bighorn sheep occurred in Wyoming until 1949, when a trapping program began at Whiskey Basin, just southeast of Dubois. Trapping efforts were sporadic between 1949-1956, largely resulting in movement of bighorns to the Sybille Unit for captive uses. After 1956, trapping was done primarily for relocation purposes.

Between 1949-1995, 1,904 bighorn sheep (Table 1) were captured and removed from various portions of the Whiskey Basin winter range. Out of 1,904 sheep captured, 1,888 bighorns were successfully released into the wild. In 61 separate transplant actions, 1,489 bighorns were released within Wyoming's borders (Fig. 1), while 399 bighorn sheep have been provided to 5 western states (South Dakota, Utah, New Mexico, Idaho, and Nevada) in 22 separate transplant actions (Fig. 2).

The only other known importation of mountain sheep into Wyoming occurred in 1992, when 22 Rocky Mountain bighorns from Morgan Creek (near Challis, Idaho) were released in Shell Canyon on the west slope of the Bighorn Mountains (Easterly 1996).

Over the past 6 decades, Wyoming has actively transplanted Rocky Mountain bighorn sheep into occupied and unoccupied range, within and outside its boundaries. For the foreseeable future, Wyoming's 6,200 bighorns should remain an important component of the mountain sheep resource in western North America.

Table 1. Rocky Mountain bighorn sheep removed and transplanted from the Whiskey Basin winter range, Dubois, Wyoming, 1949-1995. *Out-of-state releases* are italicized.
