**ABSTRACT** The British Columbia Sheep Separation Program is an active working group that has members from the domestic sheep industry, wild sheep conservation groups, First Nations, and the provincial government. Our program focuses on education and outreach, coordinating the delivery of novel farm-specific mitigation projects and affecting policy change to limit or exclude domestic sheep farms from high-risk areas to protect wild sheep. With British Columbia's most recent pneumonia-related die-off likely unfolding in southern British Columbia, the program is acting on the increasing frustration and elevated profile of this issue to find effective long-term solutions.
